

METHOD AND SYSTEM FOR COLLOID EXCHANGE THERAPY

ABSTRACT OF THE DISCLOSURE

5 The present invention relates to a method and system
for using a hemofilter to treat IMRD, hepatic failure,
exogenous intoxication and other conditions associated
with toxins in a patient's blood. One treatment includes
the use of a very large pore hemofilter to remove target
complex molecules and/or target molecules from a
patient's blood and to infuse a replacement fluid into
the patient's blood to maintain a prescribed albumin
10 concentration in the patient's blood.
